clones are derived from the bovine BAC library CHORI-240

(http://www.chori.org/bacpac/bovine240.htm). For BAC library

availability, please contact Pierer de Jong (pdejong@mail.cho.org).

Clones may be purchased from BACPAC Resources

(http://www.chori.org/bacpac/ordering_information.htm). This work

was undertaken as part of the International Bovine BAC Mapping

Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the

British Columbia Genome Sciences Centre, Canada.

/note="Vector: pBluescript SK+; Site_l: EcoRI (5'-end of CDNA); Site_2: Xhol (3'-end of CDNA); Approximately 5 % of the clones correspond to cDNA from the fungi B. graminis horder and tritici, respectively. Due to a cloning attefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, Sall, Pstl). NOTE: Also due to the cloning system used Blue/White selection for recombinate is not 100% reliable. Average insert size is 1.2 kb"

                                                                                                                                                                                                                                                                                                                                                                  the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were harvested. The tissue, total RNA, and poly (A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA

//note="Vector: pCR blunt (Invitrogen); Site_1: NotI;
Site_2: NotI; seedlings were grown at 18 deg_T. C, 60 $
Site_2: NotI; seedlings were grown at 18 deg_T. C, 60 $
rel. humidity, and a photoperiod of 16 h (100 microE * s-1
* m-2). A. 8 days, seedl. were treated with ASM (syn. BTH;
20 ppm soil drench). Leaf epid. was hav. 8, 44, 48, 72.
hpt). PolyA-RNA was isolated from leaf epidermis and used
to create a cDNA-library using the Time Saver
cDNA-Synthesis Kit (Amersham). Normalisation was performed
essentially as described by Ko (1990, Nucl. Acid Res. 16,
9877) with some modification of Kohchi et al. (1995, Plant
J. 8, 771-76). Normalised cDNAs were digested with NotI
and cloned into NortI digested pCRblunt vector.

An unidirectional CDNA library generated from [Developed inflorescence and rachis (20cm-long)]. CDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"

Sequences have been trimmed to remove vector sequence and low

quality sequence with phred score less than 20. No effort was taken

to identify ESTs of fungal origin from this library, thus this EST

could be of wheat or fungal origin.

Seq primer: Strategene SK primer.

Spikes were sprayed at anthesis with Fusarium graminearum. Total RNA, and poly(A) RNA were prepared and pooled from infected spike at 0, 6, 12, 24, and bones after inoculation, a CDNA library was made, and the CDNA clones were in vivo excised to give pBluescript phagemids in G. Muchlbauer lab at the University of Minnesota (Kruger, W.M., Muchlbauer, G.J., University, C., Vance, C.). The CDNA library should contain genes of both wheat and fungal pathogen origin. Plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /clone="WHE0454"H12"

Due to a cloning artefact caused by the Kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI, PBII). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable. Average insert size is

/notes welcor: pBluescript SK+; Site 1: EcoRI (5'-end of CDNA); Site 2: Xhol (3'-end of CDNA); Approximately 5 % of the clones Correspond to CDNA from the fungi B. graminis hordei and triltici, respectively. Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadepter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. BamHI, SalI,PStI). NOTE: Also due to the cloning system used Blue/White selection for recombinats is not 100% reliable. Average insert size is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note—"Information of County, Site 1: Ecori (5'-end of County); Site 2: Xhol (3'-end of County); Approximately 5 % of the clones Correspond to County, funding 1B. grammins horden and triltici, respectively. Due to a cloning artefact caused by the kit, in most cases the Ecori site is NOT present, as well as the Ecoriadapter used for cloning. To excise the insert, restriction sites upstream Ecori should be used (e.g. BamHi, Sali,Psti). NOTE: Also due to the cloning system used Blue/White selection for recombinats is not 100% reliable. Average insert size is 1.2 kb."

Large-scale identification of expressed sequence tags involved in rice and rice blast fungus interaction

L plant Physiol. 138 (1), 105-115 (2005)
                                                                     /crom-long) vector: pSport1; Site_1: Sal1; Site_2: NotI; An unidirectional cDNA library generated from [Developed inflorescence and rachis (20cm-long)]. CDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
